

## MONOCLE

### Entropy Encrypted Network (EEN) Monitoring and Operations Platform

## Overview

---

Monocle gives your team a single place to see what is happening across your entire EEN environment in real time. It brings together infrastructure health, system status, security activity, and alerts into one product. Your team can easily track issues, review events, and understand the state of your network without jumping between disconnected tools. Built to show both live conditions and historical activity, Monocle is equally useful for day-to-day oversight, incident review, and ongoing reporting.

## Key Capabilities

---

### Infrastructure Health

- Real-time status of every node, service, and system in your environment — online, degraded, or offline — at a glance.

### Security & Event Activity

- Unified view of security alerts, events, and audit activity across all monitored systems — searchable and filterable.

### Network Map

- A live visual map of your environment — see which systems are connected, which are healthy, and which need attention.

### Alert & Incident Management

- Centralized alert handling and event review — acknowledge, investigate, and resolve incidents through a single workflow.

### Team & Access Management

- Control who can see and do what in Monocle. Add users, set permissions, and onboard new environments without complexity.

### Weekly Digest Reports

- Automatically generated weekly summary of system health and notable activity — delivered as HTML and PDF without manual review.

## Why Monocle

---

### One system, total visibility

No jumping between separate dashboards, alert tools, or reporting systems. Everything your team needs is in one consistent platform.

### Live conditions & full history

Review past activity in detail. Filterable records of all events and system changes support both daily oversight and detailed investigation.

### Useful across the whole team

Operations teams and leadership can work from the same clear views, from the network map to weekly reports, without extra translation between tools.

### Full lifecycle management

From first deployment through ongoing monitoring, alerting, and reporting — Monocle supports every stage of running your environment from a single product.
