

## Dragonglass

### Privacy & Location Protection

PRODUCT OVERVIEW · FOR LICENSED CUSTOMERS

## Overview

Every modern PC quietly broadcasts and shares signals — the Wi-Fi networks around it, system telemetry, browser data, and location indicators — that can be used to work out **where a device is** and **who is using it**, often even when a VPN is switched on. **Dragonglass** shuts those background signals down at the system level, putting you back in control of what your computer reveals about you. You choose how much protection you want; Dragonglass handles the rest automatically and keeps it in place.

## How It Works

- 1. Choose a protection mode**  
Pick the balance of privacy and connectivity that fits the moment — from everyday Wi-Fi to fully offline.
- 2. Dragonglass hardens MS Windows**  
It adjusts the right system, network, and browser settings for you — no technical know-how required.
- 3. Protection stays on**  
A background guardian re-applies your protection after every restart, sleep, or network change — and is fully reversible.

## Four Protection Modes

### Off

#### Normal - No protection

- Standard operation with all settings restored to default.

### Wireless

#### Balanced - Wi-Fi stays on.

- Eliminates background scanning; applies location, WebRTC, DNS, and telemetry protections.

### Ethernet

#### Strong - Wired only

- Turns Wi-Fi off completely for wired connections, with the full set of privacy protections — the strongest posture available.

### Isolation

#### Maximum - Fully offline.

- Disables every network adapter (Wi-Fi, Bluetooth, Ethernet, cellular) for secure offline environments.

## What Dragonglass Protects

### Location Discovery Protection

Stops Windows from sharing device location via nearby Wi-Fi, location services, and weather or widget features.

### WebRTC Leak Protection

Prevents your true network address from being exposed during video calls and everyday browsing.

### Telemetry & Tracking Blocking

Blocks known tracking and data-collection destinations that quietly correlate your device's activity.

### Browser Privacy Hardening

Applies privacy rules in Chrome, Edge, Firefox, and Brave to block location, sensor, and notification access.

### Real-Time Monitoring & Alerts

Alerts you when something is blocked, so you always know protection is active.

### Wi-Fi Background-Scan Elimination

Silences invisible background scanning, shrinking the wireless footprint your device gives off.

### DNS Leak Protection

Keeps the websites you visit hidden from unprotected behind-the-scenes DNS lookups.

### Timezone Privacy

Stops your PC's automatic timezone from advertising its true regional location.

### Trusted-App Allowlist

Lets approved apps keep working normally while everything else stays restricted.

### Always-On Enforcement

Automatically re-applies protection after every restart, sleep, or network change.

## Safe, Reversible & In Your Control

- Administrator-protected
- Creates a restore point first
- Fully reversible, any time
- Runs locally on your PC
- License-protected
- One-click emergency restore
